**2-UREIDO-THIAZOLE DERIVATIVES, PROCESS FOR THEIR  
PREPARATION, AND THEIR USE AS ANTITUMOR AGENTS**

5

The present invention relates to 2-ureido-thiazole derivatives and, more in particular, it relates to 2-ureido-1,3-thiazoles, to a process for their preparation, to pharmaceutical compositions containing them and to their  
10 use as therapeutic agents, particularly in the treatment of cancer and cell proliferative disorders.

Several cytotoxic drugs such as, e.g. fluorouracil (5-FU), doxorubicin and camptothecins result to damage DNA or to  
15 affect cellular metabolic pathways and thus cause, in many cases, an indirect block of the cell cycle.

Therefore, by producing an irreversible damage to both normal and tumor cells, these agents result in a significant toxicity and side-effects.

20 In this respect, compounds capable of being highly specific antitumor agents by selectively leading to tumor cell arrest and apoptosis, with comparable efficacy but reduced toxicity than the currently available drugs, are desirable.

25 It is well known in the art that progression through the cell cycle is governed by a series of checkpoint controls, otherwise referred to as restriction points, which are regulated by a family of enzymes known as the cyclin-dependent kinases (cdk).

30 In their turn, the cdks themselves are regulated at many levels such as, for instance, binding to cyclins.

A normal progression through the cell cycle is controlled by the coordinated activation and inactivation of different cyclin/cdk complexes. In G1, both cyclin D/cdk4 and cyclin  
35 E/cdk2 are thought to mediate the onset of S-phase. Progression through S-phase requires the activity of cyclin A/cdk2 whereas the activation of cyclin A/cdc2 (cdk1) and cyclin B/cdc2 are required for the onset of metaphases.

For a general reference to cyclins and cyclin-dependent kinases see, for instance, Kevin R. Webster et al. in Exp. Opin. Invest. Drugs, 1998, Vol. 7(6), 865-887.

5 Checkpoint controls are defective in tumor cells due, in part, to dysregulation of cdk activity. For example, altered expression of cyclin E and cdk's has been observed in tumor cells, and deletion of the cdk inhibitor p27 KIP gene in mice has been shown to result in a higher incidence  
10 of cancer.

Increasing evidence supports the idea that the cdks are rate-limiting enzymes in cell cycle progression and, as such, represent molecular targets for therapeutic intervention. In particular, the direct inhibition of  
15 cdk/cyclin kinase activity should be helpful in restricting the unregulated proliferation of a tumor cell.

It has now been found that the 2-ureido-1,3-thiazoles of the invention are endowed with cdk/cyclin kinase inhibitory  
20 activity and are thus useful in therapy as antitumor agents whilst lacking, in terms of both toxicity and side effects, the aforementioned drawbacks known for currently available antitumor drugs.

More specifically, the compounds of this invention are  
25 useful in the treatment of a variety of cancers including, but not limited to: carcinoma such as bladder, breast, colon, kidney, liver, lung, including small cell lung cancer, esophagus, gall-bladder, ovary, pancreas, stomach, cervix, thyroid, prostate, and skin, including squamous  
30 cell carcinoma; hematopoietic tumors of lymphoid lineage, including leukemia, acute lymphocytic leukemia, acute lymphoblastic leukemia, B-cell lymphoma, T-cell-lymphoma, Hodgkin's lymphoma, non-Hodgkin's lymphoma, hairy cell lymphoma and Burkett's lymphoma; hematopoietic tumors of  
35 myeloid lineage, including acute and chronic myelogenous leukemias, myelodysplastic syndrome and promyelocytic leukemia; tumors of mesenchymal origin, including fibrosarcoma and rhabdomyosarcoma; tumors of the central

and peripheral nervous system, including astrocytoma, neuroblastoma, glioma and schwannomas; other tumors, including melanoma, seminoma, teratocarcinoma, osteosarcoma, xenoderma pigmentosum, keratocanthoma, 5 thyroid follicular cancer and Kaposi's sarcoma.

Due to the key role of cdks in the regulation of cellular proliferation, these 2-ureido-1,3-thiazole derivatives are also useful in the treatment of a variety of cell 10 proliferative disorders such as, for instance, benign prostate hyperplasia, familial adenomatosis, polyposis, neuro-fibromatosis, psoriasis, vascular smooth cell proliferation associated with atherosclerosis, pulmonary fibrosis, arthritis, glomerulonephritis and post-surgical 15 stenosis and restenosis.

The compounds of the invention can be useful in the treatment of Alzheimer's disease, as suggested by the fact that cdk5 is involved in the phosphorylation of tau protein (*J.Biochem.*, 117, 741-749, 1995).

20 The compounds of this invention, as modulators of apoptosis, could be useful in the treatment of cancer, viral infections, prevention of AIDS development in HIV-infected individuals, autoimmune diseases and neurodegenerative disorder.

25 The compounds of this invention could be useful in inhibiting tumor angiogenesis and metastasis.

The compounds of this invention may also act as inhibitors of other protein kinases, e.g. protein kinase C, her2, 30 raf1, MEK1, MAP kinase, EGF receptor, PDGF receptor, IGF receptor, PI3 kinase, weel kinase, Src, Abl and thus be effective in the treatment of diseases associated with other protein kinases.

35 Several 2-ureido-1,3-thiazole derivatives are known in the art, particularly as herbicides or as synthetic intermediates for preparing herbicides [see, for a general

reference, US 3,726,891 in the name of Shell Co., and C.A. 83(1975):114381].

Just few examples among them are N'-methyl- and N'-ethyl-N-(5-bromo-2-thiazolyl)-urea; N'-methyl-, N'-ethyl- or N'-phenyl-N-(5-chloro-2-thiazolyl)-urea; N-(5-chloro-2-thiazolyl)-N',N'-dimethyl-urea; N-(5-bromo-2-thiazolyl)-N',N'-dimethyl-urea; N'-methyl- and N'-phenyl-N-(5-methyl-2-thiazolyl)-urea.

Other 2-ureido-1,3-thiazole derivatives have been described in the art as therapeutic agents.

Among them are N-methyl- and N-phenyl-N'-(5-chloro-2-thiazolyl)-urea which have been described as sedative and antiinflammatory agents in FR M. 7428 (Melle-bezons) or N-[4-(5-oxazolyl)phenyl]-N'-(5-methyl-2-thiazolyl)-urea, described as inosine 5'-monophosphate dehydrogenase inhibitor (IMPDH) in WO 97/40028 (Vertex Pharmaceuticals Inc.).

Accordingly, the present invention provides the use of a compound which is a 2-ureido-1,3-thiazole derivatives of formula (I)

The compounds of formula (I) object of the present invention and the salts thereof can be obtained, for instance, by a process comprising:

a) when R<sub>2</sub> is a hydrogen atom

reacting a compound of formula (II)

wherein R is as defined above, with a compound of formula (III)

wherein  $R_1$  is as defined above; or

b) when  $R_2$  is a hydrogen atom or has the meanings above reported

reacting a compound of formula (IV)

wherein R is as defined above, with a compound of formula (V)

wherein R<sub>1</sub> and R<sub>2</sub> are as defined above; and, if  
10 desired, converting a 2-ureido-1,3-thiazole derivative of  
formula (I) into another such derivative of formula (I),  
and/or into a salt thereof.

The compounds of formula (I) can alternatively be obtained  
15 by a process comprising:

reacting a compound of formula (II) wherein R is as described above with 4-nitrophenyl-chloroformate, or a polymer supported form of it, thus obtaining a compound of formula (VI), or a polymer supported form of it,

wherein R is as described above; and reacting a compound of formula (VI) with a compound of formula (V)

wherein R<sub>1</sub> and R<sub>2</sub> are as described above; and, if desired,  
25 converting a 2-ureido-1,3-thiazole derivative of formula  
(I), or a polymer supported form of it, into another such  
derivative of formula (I), and/or into a salt thereof.

More particularly, when referring to the process performed by using polymer supported species, the synthetic pathway can be summarized as follows:

In addition, when referring to the process performed by using polymer supported species, conventional reaction conditions are well known to the skilled man.

It is further clear to the man skilled in the art that if the compound of formula (I), prepared according to the above processes, is obtained as an admixture of isomers, their separation into the single isomers of formula (I) according to conventional techniques is still within the scope of the present invention.

Likewise, the conversion into the free 2-ureido-1,3-thiazole derivative (I) of a corresponding salt thereof, according to well-known procedures in the art, is still within the scope of the invention.

The above process-variants are analogy processes which can be carried out according to well known methods.

The reaction between a compound of formula (II) and a compound of formula (III), or the reaction between a compound of formula (IV) and a compound of formula (V), can be carried out in a suitable solvent such as, for instance,  
5 dichloromethane, chloroform, tetrahydrofuran, diethyl ether, 1,4-dioxane, acetonitrile, toluene or acetone, at a temperature ranging from room temperature to reflux for a time varying between about 1 to 96 hours.

The reaction of a compound of formula (II) to give a  
10 compound of formula (VI) is carried out with 4-nitrophenylchloroformate, or a polymer supported form of it, in the presence of a tertiary base such as, for instance, triethylamine, N-methylmorpholine, N,N-diisopropylethylamine or pyridine, in a suitable solvent  
15 such as toluene, dichloromethane, chloroform, diethylether, tetrahydrofuran, acetonitrile, dioxane or N,N-dimethylformamide, at a temperature ranging from approximately -10°C to room temperature.

The reaction between a compound of formula (VI) and a  
20 compound of formula (V) to give a compound of formula (I) can be carried out in a suitable solvent such as toluene, dichloromethane, chloroform, diethylether, tetrahydrofuran, acetonitrile, 1,4-dioxane or N,N-dimethylformamide, at a temperature ranging from about room temperature to reflux.

25 In the above-mentioned scheme, as far as the solid phase approach is concerned, compound (VIII) can be prepared by reacting compound (VII) with 4-mercaptophenol in the presence of a base such as potassium tert-butoxide, potassium carbonate or potassium sodium hydroxide and in a  
30 suitable solvent such as N,N-dimethylformamide at a temperature ranging from 40 to 60 °C. The reaction between compound (VIII) and p-nitrophenylchloroformate to give compound (IX) can be carried out in presence of a base such as  
35 N-methylmorpholine, triethylamine or N,N-diisopropylethylamine in a suitable solvent such as dichloromethane, chloroform, 1,4-dioxane or N,N-dimethylformamide at room temperature.

The reaction between compound (IX) and the compound of formula (II), wherein R is as described above, thus obtaining the compound of formula (X), can be carried out in a suitable solvent such as dichloromethane, chloroform, toluene or N,N-dimethylformamide at room temperature for a time varying between about 2 to 22 hours.

The reaction between the compound of formula (X), wherein R is as described above, and the compound of formula (V) wherein R<sub>1</sub> and R<sub>2</sub> are as described above, thus obtaining the compound of formula (I), can be carried out in the presence of a base such as triethylamine, N,N-diisopropylethylamine or N-methylmorpholine in a suitable solvent such as toluene, acetonitrile or N,N-dimethylformamide at a temperature ranging from room temperature to 100°C.

Also the optional conversion of a compound of formula (I) into another compound of formula (I) can be carried out according to known methods.

As an example, the nitro group of a compound of formula (I) may be converted into an amino group by treatment, for example, with stannous chloride in concentrated hydrochloric acid and by using, if necessary, an organic solvent such as acetic acid, 1,4-dioxane and tetrahydrofuran, at a temperature varying between room temperature and about 100°C.

Likewise, an alkylthio or an arylthio group may be converted into the corresponding alkylsulfonyl and arylsulfonyl group by reaction, for example, with m-chloroperbenzoic acid in a suitable solvent such as dichloromethane or chloroform, at a temperature varying from about -5°C and room temperature.

The optional salification of a compound of formula (I) or the conversion of a salt into the free compound as well as the separation of a mixture of isomers into the single isomers may be carried out by conventional methods.

35

The compounds of formula (II) and (IV) according to the above processes are known compounds or can be obtained according to known methods.

For example, a compound of formula (II) wherein R is as defined above can be obtained by reacting a compound of formula (XI)

- 5 wherein X is a bromine or chlorine atom, with thiourea in a suitable solvent such as methanol, ethanol, tetrahydrofuran, 1,4-dioxane or toluene, at a temperature varying between room temperature and reflux, for a suitable time ranging from about 1 hour to about 24 hours.
- 10 A compound of formula (IV) can be obtained, for instance, by reacting a compound of formula (II) wherein R is as defined above with bis(trichloromethyl) carbonate or trichloromethyl chloroformate in the presence, if necessary, of a tertiary base such as triethylamine, N,N-
- 15 diisopropylethylamine or pyridine, in a suitable solvent such as dichloromethane, chloroform or toluene, at a temperature ranging from about -20°C to reflux.
- The compounds of formula (III), (V) and (XI) are well-known commercially available compounds or, alternatively, may be
- 20 conventionally prepared according to known methods in organic chemistry.

When preparing the compounds of formula (I) according to the process object of the present invention, optional functional groups within both the starting materials or the

25 intermediates thereof, which could give rise to unwanted side reactions, need to be properly protected according to conventional techniques.

Likewise, the conversion of these latter into the free deprotected compounds may be carried out according to known

30 procedures.

### Pharmacology

The compounds of formula (I) are active as cdk/cyclin inhibitors as they gave positive results when tested

35 according to the following procedure.

The compounds of formula (I) are therefore useful to restrict the unregulated proliferation of tumor cells, hence in therapy in the treatment of various tumors such as, for instance, carcinomas, e.g. mammary carcinoma, lung carcinoma, bladder carcinoma, colon carcinoma, ovary and endometrial tumors, sarcomas, e.g. soft tissue and bone sarcomas, and the hematological malignancies such as, e.g., leukemias.

In addition, the compounds of formula (I) are also useful in the treatment of other cell proliferative disorders such as psoriasis, vascular smooth cell proliferation associated with atherosclerosis and post-surgical stenosis and restenosis and in the treatment of Alzheimer's disease.

The inhibiting activity of putative cdk/cyclin inhibitors and the potency of selected compounds was determined through a method of assay based on the use of the MultiScreen-PH 96 well plate (Millipore), in which a phosphocellulose filter paper was placed at each well bottom allowing binding of positive charged substrate after a washing/filtration step.

When a radioactivity labelled phosphate moiety was transferred by the ser/threo kinase to the filter-bound histone, light emitted was measured in a scintillation counter.

The inhibition assay of cdk2/Cyclin A activity was performed according to the following protocol:

**Kinase reaction:** 1.5  $\mu$ M histone H1 substrate, 25  $\mu$ M ATP (0.5  $\mu$ Ci  $P^{33}\gamma$ -ATP), 30 ng Cyclin A/cdk2 complex, 10  $\mu$ M inhibitor in a final volume of 100  $\mu$ l buffer (TRIS HCl 10 mM pH 7.5, MgCl<sub>2</sub> 10 mM, 7.5 mM DTT) were added to each well of a 96 U bottom well plate. After 10 min at 37 °C incubation, reaction was stopped by 20  $\mu$ l EDTA 120 mM.

**Capture:** 100  $\mu$ l were transferred from each well to MultiScreen plate, to allow substrate binding to phosphocellulose filter. Plates were then washed 3 times with 150  $\mu$ l/well PBS  $\text{Ca}^{++}/\text{Mg}^{++}$  free and filtered by  
 5 MultiScreen filtration system.

**Detection:** filters were allowed to dry at 37°C, then 100  $\mu$ l/well scintillant were added and  $^{32}\text{P}$  labelled histone H1 was detected by radioactivity counting in the Top-Count  
 10 instrument.

**Results:** data were analysed and expressed as % inhibition referred to total activity of enzyme (=100%). All compounds showing inhibition  $\geq 50$  % were further analysed in order to study and define potency ( $\text{IC}_{50}$ ) as  
 15 well as the kinetic-profile of inhibitor through  $K_i$  calculation.

$\text{IC}_{50}$  determination: the protocol used was the same described above, where inhibitors were tested at concentrations ranging from 0.0045 to 10  $\mu\text{M}$ . Experimental  
 20 data were analyzed by the computer program GraphPad Prizm.

$K_i$  calculation: either the concentration of ATP and histone H1 substrate were varied: 4, 8, 12, 24, 48  $\mu\text{M}$  for ATP (containing proportionally diluted  $\text{P}^{32}\gamma\text{-ATP}$ ) and 0.4, 0.8, 1.2, 2.4, 4.8  $\mu\text{M}$  for histone were used in absence and  
 25 presence of two different, properly chosen inhibitor concentrations.

Experimental data were analysed by the computer program SigmaPlot for  $K_i$  determination, using a random bireactant system equation:

$$v = \frac{V_{\max} \frac{(A)(B)}{aK_A K_B}}{1 + \frac{(A)}{K_A} + \frac{(B)}{K_B} + \frac{(A)(B)}{aK_A K_B}}$$

35 where A=ATP and B=histone H1.

Following the method above described, a representative compound of formula (I) of the invention, which is N-(5-isopropyl-1,3-thiazol-2-yl)-N'-(3,5-dimethylphenyl)urea, showed an inhibiting activity towards the cdk2/cyclin A complex corresponding to 0.56  $\mu$ M (IC50).

In addition, the inhibiting activity of putative cdk/cyclin inhibitors and the potency of selected compounds was determined through a method of assay based on the use of a SPA (Scintillation Proximity Assay) 96 well plate assay. The assay is based on the ability of streptavidin coated SPA beads to capture a biotinylated peptide derived from a phosphorylation site of histone.

When a radioactivity labelled phosphate moiety was transferred by the ser/threo kinase to the biotinylated histone peptide, light emitted was measured in a scintillation counter.

The inhibition assay of cdk5/p25 activity was performed according to the following protocol:

**Kinase reaction:** 1.0  $\mu$ M biotinylated histone peptide substrate, 0.25 uCi P33g-ATP, 4 nM cdk2/p25 complex, 0-100  $\mu$ M inhibitor in a final volume of 100  $\mu$ l buffer (Hepes 20 mM pH 7.5, MgCl2 15 mM, 1 mM DTT) were added to each well of a 96 U bottom well plate. After 20 min at 37 °C incubation, the reaction was stopped by the addition of 500 ug SPA beads in phosphate-buffered saline containing 0.1% Triton X-100, 50 uM ATP and 5 mM EDTA. The beads were allowed to settle, and the radioactivity incorporated in the <sup>33</sup>P-labelled peptide was detected in a Top Count scintillation counter.

**Results:** Data were analyzed and expressed as % Inhibition using the formula:

$$100 \times (1 - (\text{Unknown} - \text{Bkgd}) / (\text{Enz. Control} - \text{Bkgd}))$$

IC50 values were calculated using a variation of the four parameter logistics equation:

$$Y = 100/[1 + 10^{((\text{LogEC50} - X) * \text{Slope})}]$$

Where  $X = \log(\mu\text{M})$  and  $Y = \% \text{ Inhibition}$ .

5 The compounds of formula (I) are therefore useful to restrict the unregulated proliferation of tumor cells, hence in therapy in the treatment of various tumors such as, for instance, carcinomas, e.g. mammary carcinoma, lung carcinoma, bladder carcinoma, colon carcinoma, ovary and  
10 endometrial tumors, sarcomas, e.g. soft tissue and bone sarcomas, and the hematological malignancies such as, e.g., leukemias.

In addition, the compounds of formula (I) are also useful in the treatment of other cell proliferative disorders such  
15 as psoriasis, vascular smooth cell proliferation associated with atherosclerosis and post-surgical stenosis and restenosis and in the treatment of Alzheimer's disease.

7.98 g (39.6 mmol) of 4-nitrophenylchloroformate and 4.35 ml (39.6 mmol) of N-methylmorpholine were added to 24 g (19.8 mmol) of the polymer supported compound (VIII) swelled in 200 ml of dichloromethane under argon atmosphere. The mixture was stirred at 22°C for 22 hours. The obtained compound (IX) was filtered, washed with dichloromethane, methanol and evaporated under vacuum. The loading of 4-nitro-phenylchloroformate on the resin was calculated from the percentage of sulfur determined via microanalysis: S 2.34 %; loading 0.731 mmol S/g. The disappearance of the OH band (broad strong band 3400 nm) and the appearance of carbonate group were monitored via DRIFTS (strong band 1785 nm).

#### EXAMPLE 19

##### Preparation of a polymer supported compounds (X)

A solution of 2-amino-5-isopropyl-1,3-thiazole (39.6 mmol) in 12.5 ml of dichloromethane was added to the polymer supported compound (IX) (19.8 mmol) swelled in 200 ml of dichloromethane under argon atmosphere. The mixture was stirred at 22°C for 22 hours. The obtained compound (X) was filtered, washed with dichloromethane, methanol and evaporated under vacuum. The loading of 2 amino-5-isopropyl-1,3-thiazole on the resin was calculated from the percentage of sulfur determined via microanalysis: S 4.21

%; loading 0.724 mmol<sup>+</sup>S/g. The presence of carbamate group was confirmed via DRIFTS (strong band 1742 nm).

#### EXAMPLE 20

##### 5 Preparation via parallel synthesis of the compounds of formula (I)

The amines (V) (0.236 mmol) and N,N-diisopropylethylamine (0.236 mmol) were added to the polymer supported compounds (X) (0.118 mmol) swelled in 3 ml of toluene in the Argonaut  
 10 Quest 210 apparatus vessels. 128 mg (4 eq) of N,N-diisopropylethylamine resin bounded (PS-DIEA loading 3.68 mmol/g) was used whenever the amines were in the salified form. The reactions were stirred for 22 hours at 60°C, then the reaction mixtures were filtered and the resin  
 15 washed with dichloromethane. The liquid phase, recovered in Climax test tubes, was evaporated under nitrogen flux at 35°C using Liebig Thermochem Metal-block thermostat. The obtained crude products were triturated with diethylether-dichloromethane and the resulting solids were filtered on  
 20 frit equipped syringes (Alltech extract-clean filter tubes 1.5 ml, Alltech Teflon frits for 1.5 ml tubes). The products were finally dried under vacuum.
